Zu der

Trigonometrie und Ausziehung der Wurtzeln Nöthige Tafeln

Darinnen

Die Sinus und Tangentes für jede Minute des Quadrantens

Nebst

Ihren Logarithmis und den Logarithmis der gemeinen Zahlen von 1. biß 10000.

Wie auch

Die Quadrat- und Cubic-Zahlen von 1. biß 1000. enthalten sind,

Nebenst

Einer allgemeinen Regel, alle geradelinichte und Sphärische Triangel aufzulösen, herausgegeben

Von

Christian Wolffen,

Hochfürstl. Heßischen Hof-Rathe u. Mathem. & Phil. Prof. Primario zu Marburg, Professore honorario zu St. Petersburg, der Königl. Groß-Britannischen, wie auch der Königl. Preuß. Societät der Wissenschafften Mitgliede.

Halle im Magdeburgischen,

Zu finden in der Rengerischen Buchhandl. 1728.

Vorrede.

Auf die Trigonometrie ist man durch die Astronomie gebracht worden. Denn als sich einige scharfsinnige Männer, welche die Natur mit grossem Verstande und hoher Tugend für andern begabet, auf die Betrachtung des Himmels geleget; haben sie bald wahrgenommen, daß ohne Auflösung der Triangel in der Astronomie nichts gründliches zu erforschen sey. Daher hat Hipparchus, der sich so wohl um die Astronomie verdienet gemacht, daß ihn nicht allein die Alten biß in den Himmel erhoben, sondern auch die spä-

1 Nachwelt ohne Aufhören rühmen wird, so lange man Wahrheit und Tugend etwas gelten lässet, die Lehre von den Sehnen im Circul, wie uns Theon dessen berichtet, in zwölf Büchern abgehandelt, daraus Ptolemæus in das erste Buch seines Almagesti so viel ge-

bracht, als er die übrigen zu verſtehen nöthig erachtet. Nemlich die Alten ſchloſſen von den Winckeln auf die Seiten, vermöge der Sehnen der Circul-Bogen und theileten, wie aus des Ptolemæi Almageſto zu erſehen, den halben Diameter des Circuls in 60. gleiche Theile oder Grade, jeden Grad aber von neuem in ſeine 60. Minuten und Secunden. In ſolchen Theilen des halben Diameters hat Ptolemæus Tafeln über die Sehnen von halben zu halben Graden des Quadrantens ausgerechnet, welche Orontius Finæus, Mathematum Profeſſor zu Paris im Anfange des ſechzehenden Jahrhundertes, biß auf jede Minute eines jeden Grades erweitert. Allein ſchon lange vor ihm hatte Johannes Regiomontanus, ein um die Mathematick, abſonderlich die Aſtronomie, hochverdienter Mann, zu Auflöſung der Triangel viel beſſere Tafeln verfertiget. Denn als die Saracenen zuerſt bedachten, daß die halben Sehnen eben die Verhältniß unter einander hätten, welche die gantzen haben, und daher die Trigonometriſche Rechnungen durch kleine-

re

re Zahlen erleichtert werden könnten; haben sie die Sinus in die Trigonometrie eingeführet, jedoch ihre Verhältniß gegen den halben Diameter mit dem Ptolemæo in sechzigtheiligen Brüchen ausgedrucket. Regiomontanus nun hat nach ihrem Exempel die Sinus den Sehnen vorgezogen, aber damit er die verdrüßliche sechzigtheiligen Brüche vermiede, dem halben Diameter 60 000 000 Theile gegeben. Ja da er nach der Zeit vermerckte, es würden die Tafeln noch bequemer seyn, wenn man den halben Diameter in 10000000 Theile theilete; so hat er sichs nicht verdrüssen lassen von neuem andere Tafeln auszurechnen, darinnen der Sinus für jede Minute eines Grades in zehentheiligen Brüchen angesetzet wird. Eben dieser Regiomontanus hat noch eine andere Tafel verfertiget, die er Tabulam Fœcundam genennet, darinnen der Cosinus in solchen Theilen angesetzet wird, deren 10000000. einem jeden Sinui zukommen. Ja Georgius Joach. Rheticus hat auch den halben Diameter des Circuls *AC* (Fig. 1.) in solchen Theilen

ausgerechnet, deren ein jeder Sinus *AD* oder *DC* 10000000. hat. Allein da auf solche Art die zur Trigonometrie gehörige Tafeln viel zu weitläufftig werden, wie aus dem Opere Palatino de Triangulis, welches Rheticus angefangen, Valentinus Otto vollendet, zur gnüge erhellet; so lässet man sich mit den blossen Sinibus in solchen Theilen gerechnet, begnügen, deren der halbe Diameter 1000000 hat, ausser daß man die Rechnung in einigen Fällen zu erleichtern die Tangentes und zuweilen auch wohl die Secantes mit dazu nimmet. Maginus hat gar die Sinus versos mit hinzugesetzet. Rheticus hat diese Tafeln nur von zehen zu zehen Secunden; Pitiscus aber in seinem grossen Canone auf alle Secunden einer jeden Minute gerechnet. Sie haben aber eine gantz andere Gestalt gewonnen, da **Johann Neper**, ein Schottländischer Baron, A. 1614. die logarithmos in die Trigonometrie eingeführet. Er hat aber für den logarithmum sinus totius oder des halben Diameters 0 angenommen, so daß die logarithmi immer abneh-

nehmen, indem die Sinus zunehmen. Dieſe Tafeln, welche der ſinnreiche Urheber derſelben Canonem Mirificum genennet, hat **Benjamin** Urſinus biß von zehen zu zehen Secunden erweitert. Unerachtet aber **Neper** nicht ohne Urſache für den logarithmum ſinus totius eine Nulle angenommen, damit nemlich in Auflöſung der rechtwincklichten Triangel kein addiren und ſubtrahiren nöthig wäre, ſo offte man den ſinum totum entweder addiren oder ſubtrahiren ſoll; ſo hat er doch ſelbſt hernach wahrgenommen, daß die logarithmi viel bequemer fallen würden, wenn der logarithmus von 1. eine Nulle wäre und alſo die logarithmi zunähmen, indem die Zahlen zunehmen. Dannenhero hat Henricus Briggius, Profeſſor Geometriæ zu Orfurt, einen neuen Canonem logarithmorum für die gemeinen Zahlen von 1. biß 20000 und von 90 000 biß 100000. verfertiget und mit ſeiner Arithmetica Logarithmica an. 1624. herausgegeben: welche bald darauf, nemlich an. 1628. Adrianus Vlacq von neuem wieder aufgeleget und die loga-

rithmos von 20000 biß 90000 vor ſich dazu gethan. Zwar hatte Briggius auch für die ſinus und tangentes auf alle hundert Theile eines Grades die neuen logarithmos gerechnet, welche Henricus Gellibrand in der Trigonometria Britannica an. 1633. nach ſeinem Tode publiciret, allein weil die zehentheiligen Brüche der Grade von den Mathematicis noch nicht angenommen worden, ſo hat Vlacq die logarithmos nach der neueren Art von zehen zu zehen Secunden in eben demſelben Jahre herausgegeben. Für jede Secunden hat mit groſſer Mühe der Seel. Herr von Löſer, der nicht weniger wegen ſeiner groſſen Gelahrheit, als ſeines alten und vornehmen Geſchlechtes wegen bekandt iſt, dieſelben gerechnet; allein der frühzeitige Todt hat es gehindert, daß er das Werck nicht völlig zu ſtande gebracht. Solte ſich aber jemand finden, der es an das Tagelicht bringen wollte: ſo würden die Hochadelichen Erben dieſes nützliche Werck der gelehrten Welt nicht mißgönnen. Ich habe nach gewöhnlicher Art Vlacqs Tafeln

feln auf die Minuten reduciret und die drey letzten Zahlen zur Rechten weggelassen, dergestalt, daß ich die letzte Zahl um 1. vermehret, wenn über 550 weggeworffen worden. Und nach den grossen Tafeln des Vlacqs habe ich die logarithmos sinuum und tangentium corrigiret; nach diesem aber selbige gegen gar viele Auflagen gehalten, damit ich so wohl durch Hülffe der Logarithmischen Differentien, so bey dem Vlacq stehen, als nach der von ihm in der Vorrede vorgeschriebenen Methode finden möchte, in welcher Auflage der Fehler steckte. Die Logarithmos für die gemeine Zahlen habe ich aus des Briggii Arithmetica Logarithmica genommen und sie wie die vorigen um einige Zahlen verkleinert. Im corrigiren habe ich eben den Fleiß, wie in den vorigen angewendet. Die Logarithmos habe ich von ihren zugehörigen sinibus und tangentibus abgesondert, damit die cosinus und cotangentes auf einer Seite stünden und daher der Cosinus mit dem Sinu gleich in die Augen fiele, folgends

im Aufſuchen nicht der geringſte Verdruß übrig bliebe. Man könte zwar in der Trigonometrie die ſinus und tangentes gar entrathen und mit den logarithmis allein vergnüget ſeyn: jedoch weil ſie in vielen andern Fällen nützlich ſind, ich auch in meinen Anfangs-Gründen mich hin und wieder auf dieſelben beruffen, ſo habe ſie nicht gar weglaſſen wollen. Denn ich habe dieſe Tafeln zu dem Ende herausgegeben, damit ſie denen Anfangs-Gründen der Mathematiſchen Wiſſenſchafften beygefüget werden könten, in welchen ſie gar viel gebraucht werden. Derowegen habe ich auch die Tafel der Quadrat- und Cubic-Zahlen mit hinzugeſetzt, damit ſie ſo wohl zur Zuſammenſetzung, als zur Auflöſung derſelben dienen möchten, welches in vielen Orten der Anfangs-Gründe erfordert wird. Endlich weil die Anfänger wegen der vielen Regeln für der Trigonometrie, ſonderlich der Sphäriſchen, einen Abſcheu haben; ſo gebe ich hier ihnen eine einige Regel, dadurch ſie nebſt einigen wenigen Anmerckungen

gen für einige besondere Fälle alle Aufgaben beyder Trigonometrie auf einerley Art auflösen können, also daß nunmehro klahr ist, es brauche nicht mehr Mühe die Sphärischen, als die geradelinichten Triangel aufzulösen. Es hat längst Neper bey seinem Canone mirifico eine allgemeine Regel alle Sphärische Triangel aufzulösen gegeben: Allein ich weiß nicht, wie sie, absonderlich in unsern Landen, so gar ins Vergessen kommen. Der Herr Professor Krüger in Bremen hat (welches ich hier mit Danck rühme) mir den ersten Winck davon gegeben. Ehe mir aber des Nepers Canon mirificus und des Norwoods Trigonometrie or the doctrine of triangles, darinnen er dieselbe Regel umständlicher erkläret und erwiesen hat, zu Händen kam; habe ich mich selbst eine dergleichen Regel zu suchen bemühet und auf die Art und Weise, die ich in meinen Elementis Matheseos zeige, eine gefunden, die wenig von der Neperischen unterschieden ist. Als ich aber ferner nachdachte, ob nicht eine Gleichheit zwischen

der

der Auflösung der geradelinichten und der Sphärischen Triangel zu finden sey, habe ich nicht ohne sonderbahres Vergnügen wahrgenommen, daß durch einerley Regel alle Aufgaben in beyder Trigonometrie aufgelöset werden können. Ich habe aber die Regel behalten, wie sie von mir gefunden worden; weil dadurch die Gleichheit zwischen beyden Trigonometrien besser als durch die Neperische erhellet. Wolte jemand sagen, ich hätte aus dieser Absicht die Neperische nur verändert; so werde ich mir es auch gefallen lassen, massen ich keinen andern Lohn vor meine Arbeit suche, als daß ich andern gedienet habe.

Gebrauch der Tafeln.

§. 1.

IN der Trigonometrie findet man aus drey gegebenen Theilen eines Triangels, er mag recht-winckligt, oder sphärisch seyn, die drey übrigen, indem man von den Sinibus und Tangentibus der Winckel auf die Seiten der geradelinichten, oder auf die Sinus und Tangentes der Seiten in den sphärischen schliesset. Daher hat man in Trigonometrischen Rechnungen die Tafeln der Sinuum und Tangentium nöthig.

§. 2.

Es ist aber des Winckels ACD Sinus AD die Helffte der Sehne AB, die dem Bogen AEB unterzogen wird, dessen Helffte AE das Maaß des Winckels ACD ist. Der Cosinus AG aber ist der Sinus des Winckels ACH, der mit dem vorigen ACE 90. Grad machet. Fig. 1.

§. 3.

Die Tangens des Winckels ACD ist die gerade Linie EF, so auf dem halben Diameter CE, damit das Maaß des Winckels beschrieben worden, perpendicular stehet und die Secantem FC in F erreichet. Die Cotangens aber ist die Tangens des Winckels ACH, der mit dem vorigen ACD 90. Grad machet.

§. 4.

Der halbe Diameter EC, dessen gedacht worden, heisset der Sinus totus, weil er der grösse unter

allen und die übrigen als seine Theile angesehen werden.

§. 5.

Nemlich in den Tafeln der Sinuum und Tangentium findet man, wie viel solcher Theile einem jeden derselben zugehören, dergleichen der Sinus totus 10000000 hat.

§. 6.

Da man nun alle Aufgaben bey der Trigonometrie durch die Sinus und Tangentes auflösen kan: so könte man mit den Tafeln derselben einig und allein zu frieden seyn. Allein da die Multiplication und Division durch grosse Zahlen sehr beschwehrlich ist, so sind die Logarithmischen Zahlen an ihre Stelle kommen, als welche das multipliciren in addiren; das dividiren in subtrahiren verkehren. Von ihrer Natur und Beschaffenheit habe ich in meinen Anfangs-Gründen geredet. Darinnen ich auch die Ausrechnung aller zur Trigonometrie gehörigen Tafeln abgehandelt.

§. 7.

Wenn wir aber in Trigonometrischen Rechnungen die Logarithmos Sinuum und Tangentium brauchen, so müssen auch die Seiten der geradelinichten Triangel durch Logarithmos ausgedrucket werden. Zu dem Ende ist die Tafel der Logarithmorum für gemeine Zahlen ausgerechnet worden.

§. 8.

Damit nun erhelle, wie durch die Logarithmischen Tafeln alle geradelinichte und sphärische Trian-

Triangel aufgelöſet werden; ſo will ich zuerſt von den rechtwincklichten, hernach von den ſchiefwincklichten mit wenigem reden.

§. 9.

In jeden rechtwincklichtem Triangel ſind über den rechten Winckel, auf den wir hier nicht ſehen, fünff Theile, nemlich zwey ſchiefe Winckel A und C und drey Seiten AB, AC, BC. Von dieſen werden in jedem Falle zwey gegeben, das dritte wird geſucht. Z. E. Es wird gegeben die Hypothenuſe AC mit dem ſchiefen Winckel A, man ſoll die ihm entgegenſtehende Seite BC ſuchen. Wenn man nun acht hat, wie dieſe Theile auf einander folgen; ſo wird man inne werden, daß eines von ihnen in der Mitten ſtehet, die übrigen beyde entweder an demſelben anliegen, oder von ihm durch ein anderes Theil abgeſondert ſind. Z. E. In dem gegebenen Falle iſt BC der mittlere Theil: von ihm wird AC durch den Winckel C; hingegen der Winckel A durch die Seite AB abgeſondert, denn auf den rechten Winckel hat man, wie ich ſchon erinnert, hier nicht zu ſehen. Hingegen wenn die beyden Seiten AB und BC gegeben werden, und man ſoll den Winckel A ſuchen; ſo iſt die Seite AB der mittlere Theil und die übrigen A und BC liegen an demſelben zu beyden Seiten. Die Theile zur Seiten wollen wir in dem erſten Falle **die Anliegenden**; in dem andern aber **die Abgeſonderten** nennen. Fig. 2. 3.

§. 10.

Die Anfänger haben ſich nun vor allen Dingen darinnen zu üben, daß ſie die Theile der Tri-

angel, so in Trigonometrischen Aufgaben vorkommen, solchergestalt von einander unterscheiden lernen; so wird es ihnen nicht schwer fallen alle Aufgaben beyder Trigonometrie von rechtwincklichten Triangeln durch diese allgemeine Regel aufzulösen,

Der Sinus totus **mit dem** Cosinu **des mittleren Theiles ist gleich den** Sinibus **der abgesonderten und den** Cotangentibus **der anliegenden.**

wenn sie nur mercken, daß man in sphärischen Triangeln für die beyden Seiten AB und BC ihre Complemente zu 90. Graden oder dem Quadranten; in den geradelinichten aber vor die Sinus und Tangentes die Seiten selber annimmet.

§. II.

Es sey z. E. gegeben die Hypothenuse AC mit dem anliegenden Winckel A, man soll die ihm entgegenstehende Seite BC finden. Da nun hier BC **der mittlere Theil** ist, hingegen AC und A zu beyden Seiten von ihm **abgesondert** sind, so ist nach der allgemeinen Regel, **der** Sinus totus **mit dem** Cosinu **des Complementes von** BC, **das ist, mit dem** Sinu **der Seite** BC, **dem** Sinibus **der Hypothenuse** AC **und des schiefen Winckels** A **gleich.** Derowegen wenn es ein sphärischer Triangel ist, so wird von den Sinibus der Hypothenuse AC und des schiefen Winckels A der Sinus totus abgezogen, damit der Sinus der Seite BC übrig bleibet. Ist es aber ein rechtwincklichter Triangel, so wird von der Hypothenuse AC und dem Sinu des Winckels A der Si-

nus

nus totus abgezogen, damit die Seite BC übrig bleibet.

§. 12.

Der Gebrauch der Regel wird überaus leichte, wenn sie in einem jeden vorkommenden Falle in eine Analytische Gleichung gebracht wird: denn so lehret der blosse Anblick derselben, was zu thun ist. Als in unserem Exempel ist

Sin. tot. † Sin. BC = Sin. AC † Sin. A.

Derowegen damit man den Sinum artificialem, oder Logarithmum Sinus von BC bekomme; muß der Sinus totus von den Sinibus der Seite AC und des Winckels A abgezogen werden: welches der erste Anblick gleich zu erkennen giebet.

§. 13.

Durch eben diese Regel können alle schiefwinckl. Fig. 4. 5.
lichte Triangel (einen einigen Fall ausgenommen) aufgelöset werden, wenn man sie vermittelst des Perpendiculs DC in zwey rechtwincklichte resolviret. Jedoch da auf solche Art besonders in einigen Fällen die Rechnung ohne Noth weitläufftig würde: so sind noch folgende Anmerckungen zu behalten.

§. 14.

Es ist nemlich zu wissen, daß in jedem sphärischen Triangel die Sinus der Seiten, in jedem geradelinichten die Seiten selber den Sinibus der ihnen entgegen stehenden Winckel gleich sind, das ist, wenn man sich der Logarithmischen Zahlen bedienet, der Sinus einer Seite AC mit dem Sinu des anliegenden Winckels A dem Sinui der andern Seite BC

mit dem Sinu des bey ihr anliegenden Winckels B gleich sey. Durch diese Regel wird in jedem Triangel aus zwey gegebenen Seiten und dem einer entgegen stehenden Winckel derjenige Winckel gefunden, welcher der anderen entgegen stehet, oder auch aus zwey Winckeln und der Seite, so einem gegen über stehet, die dem anderen entgegen gesetzte Seite.

§. 15.

Fig. 4. 5. 6. 7. In den übrigen Fällen wird der schiefwincklichte Triangel durch das Perpendicul DC in zwey rechtwincklichte resolviret und durch die allgemeine Regel das eine Stücke AC von der Grundlinie AB gesucht, welches entweder von ihr abgezogen, oder zu ihr addiret DB giebet. Worauf durch folgende Regel, welche aus der allgemeinen fliesset,

Der mittlere Theil in dem rechten Triangel mit dem zur Seiten im Lincken ist gleich dem mittleren Theile im Lincken mit dem zur Seiten im Rechten.

Es wird aber das Perpendicul DC für den anderen Theil zur Seite gehalten, welches man also nicht erst nöthig hat durch die allgemeine Regel, wie insgemein geschiehet, zu suchen. Es ist aber aus eben der allgemeinen Regel klar, ob man die Tangentes, oder die Sinus brauchen solle.

§. 16.

Fig. 4. Es wird z. E. im Triangel ACB der Winckel A mit den Seiten AC und AB gegeben, man soll den Winckel B finden. Da nun in dem bey D rechtwincklichten Triangel ACD der mittlere Theil

Theil A iſt, die beyden Seiten aber AC und AD beyderſeits anliegen; ſo iſt vermöge der allgemeinen Regel der Sinus totus mit dem Coſinu des Winckels A gleich der Cotangenti von der Hypothenuſe AC und der Cotangenti des Complementes, das iſt, der Tangenti von der Seite AD. Dannenhero wird AD gefunden, wenn man von dem Sinu toto und dem Coſinu des Winckels A die Cotangentem der Hypothenuſe AC abziehet. Subtrahiret man nun ferner das Stücke AD von der Grundlinie AB, ſo bleibet das andere Stücke DB übrig. Wenn man nun DC für den einen Theil zur Seite in beyden Triangeln annimmet, ſo iſt im Lincken ACD die Seite AD der mittlere Theil, und der Winckel A lieget an ihm an; hingegen im rechten DCB iſt DB der mittlere Theil und der Winckel B lieget abermal an ihm an. Derowegen muß man bey den Winckeln A und B die Cotangentes brauchen; Solchergeſtalt iſt (§. 15.) der Sinus des einen Stücks der Grundlinie AD mit der Cotangente des Winckels B dem Sinui des andern DB mit der Cotangente des Winckels A gleich. Damit nun der verlangte Winckel B gefunden werde, ſo muß man den Sinum des Stückes AD von dem Sinu des andern DB und der Cotangente des Winckels A abziehen.

§. 17.

Endlich aus drey gegebenen Seiten in einem ſchiefwincklichtem Triangel wird der Winckel, A gefunden, wenn man ihn wie vorhin vermittelſt des Perpendiculs DC in zwey rechtwincklichte Fig. 4.

reſol-

reſolviret und hierauf inferiret: **Wie die** Tangens **der halben Grundlinie** AB **zur** Tang. **der halben Summe der beyden Seiten** AC **und** CB; **ſo verhält ſich die** Tangens **von der halben Differentz ſelbiger Seiten zur** Tangenti **der halben Differentz beyder Stücke** AD **und** BD. Wenn nun die gefundene halbe Differentz von der halben Grundlinie AB abgezogen wird, ſo bleibet das kleine Stücke AD übrig. Addiret man ſie aber dazu, ſo kommet das groſſe Stücke DB heraus. Da nun in dem bey D rechtwincklichtem Triangel ACD die Seite AD mit der Hypothenuſe AC bekandt iſt; ſo kan man den verlangten Winckel A durch die allgemeine Regel finden. Es findet aber eben dieſe Regel bey den geradelinichten Triangeln ſtatt, wenn man vor die Tangentes die Seiten ſelber annimmet.

§. 18.

Dieſes iſt der vornehmſte Gebrauch der Logarithmiſchen Tafeln. Von anderem vielfältigem Nutzen würde zu weitläufftig ſeyn hier zu reden.

§. 19.

Endlich die Tafeln der Quadrat- und Cubic-Zahlen habe ich zu dem Ende vornemlich mit beydrucken laſſen, daß ſie in Ausziehung beyder Wurtzeln eine Erleichterung geben möchten: maſſen man durch dieſelben durch den erſten Angriff bald drey Theile der Wurtzeln auf einmal finden kan.
